## DE FACTO POPULATION

On Census Day, May 12, 1980, Bermuda's total de facto population (i.e., all persons who had spent the previous night in Bermuda) numbered 67,761. This total consisted of 33,621 males and 34,140 females. Thus there were 985 males for every 1,000 females living in Bermuda on Census Day. (See Table 1.1 in Chapter 5.)

The total de facto population was made up of three major categories of persons: the Civilian Population, including
inmates of hospitals and prisons, numbering 54,670 or 81\%; the Amed Forces and their dependents living on bases numbering 2,173 or 3\%; and Visitors and Transients numbering 10,918 or 16\%.

By comparison with the 1970 Census figures, the de facto population in 1980 was only 1,275 greater. Of the three major groups, the Civilian population was up 1,694 , Visitors and Transients were up 5,467 and Foreign Amed Forces residing on bases were down 821.
tABLE (i) SLMMARY OF MAJOR COMPONENTS OF THE DE FACTO POPULATION FOR 1980 AND 1970 (Derived from Table 1)

| Category of Population | De Facto Population |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number (2) |  | Percentage <br> Distribution (1) |  | $\frac{\text { Percentage Change }}{1970 \text { to } 1980}$ |
|  | 1980 | 1970. | 1980 | 1970 |  |
| Total | 67,761 | 66,486 | 100 | 100 | 2\% |
| Civilian Population | 54,050 (3) | 52,330 | 80 | 79 | 3\% |
| Hospitals and Prisons | 620 | 646 | 1 | 1 | -4\% |
| Ammed Forces and Dependents | 2,173 | 2,994 | 3 | 5 | -27\% |
| Visitors and Transients |  |  |  |  |  |
| Civilian | 10,918 | 5,451 | 16 | 8 | 100\% |
| Military | 0 | 5,065 (4) | 0 | 8 | -100\% |

(1) Any apparent discrepancies between sums of constituent items and totals are due to rounding of figures.
(2) 1980 totals include Foreign Armed Forces Personnel and their dependents living off bases. These were not expected to exceed 500.
(3) As was the practice in 1970, the resident population excludes persons whose age or sex was not stated. This figure is 371 persons for 1980.
(4) In 1970, there were 5,065 visiting military personnel in NATO exercises.

It is notable that between 1970 and 1980 the most significant change in the total de facto population is the growth in the number of visitors and transients. This group consists of two categories of persons:

- visitors living in tourist establishments licensed to have 5 or more beds, as well as passengers on cruise ships or yachts
- visitors living in smaller guest houses or private dwellings such as visiting relatives or persons on business assignments expected to last for a period less than 3 months.

These two groups of visitors numbered 9,724 and 1,194 , respectively. This marked rise in what constitutes "tourists" was associated with a comparatively small increase in the size of the resident civilian population. This finding indicates that the island experienced a significant improvement over the past decade in the return from tourism per head of population.

The implication that the welfare of Bermudians improved materially over the last decade is substantiated by analysis of the main demographic, economic and housing characteristics of Bermuda's resident civilian, non-institutional population.

This is the subject of the remainder of this analysis. The aforementioned population consists of the resident civilian population including Foreign Armed Forces Personnel and their dependents living off bases, but it excludes imates of prisons, asylums and hospitals.

DISTRIBUTION AND COMPOSITION OF THE CIVILIAN NON-INSTITUTIONAL POPULATIION

The civilian non-institutional population - hereinafter referred to as "the population" - rose from 52,330 in 1970 to 54,050 in 1980 , a rise of only 1,720 or $3 \%$. The absolute change in population was the smallest recorded since the period 1911-1921 when the gain was 1,133 . As a result of this small growth, population density per square mile rose slightly from 2,829 per square mile to 2,922 . (Tables ii, iii, iv)

The population increase was due to a substantial slowing down in the rate of natural increase and a net outflow of residents. The population gain due to natural increases (excess of births over deaths) was 4,800 between 1970 and 1980 , down 2,500 from the 1960 to 1970 increase of 7,300 . Since the recorded increase from 1970 to 1980 was only 1,720 , it can be assumed that there was a net outflow of 3,080 between 1970 and 1980 . This net
outflow is in stark contrast with the net inflow of approximately 2,400 estimated for the 1960 to 1970 decade.

The declining rate of natural increase was noted first during the decade of the sixties at which time it was attributed to a highly successful family planning programe. There can be little doubt that similar considerations continue to apply even more positively in the seventies.

The net outflow in population probably reflects a slowing down in the rate of econamic growth in the seventies following a period of substantial growth in the latter half of the sixties. It was noted in the 1970 Census Report that the "high net in migration was in response to marked industrial expansion which greatly exceeded the capacity of the local labour market both in terms of numbers and skills". While it continues to be true in 1980 that the local economy is dependent upon a foreign labour supply, the net outflow of residents implies either that this dependence has lessened during the recent decade or that Bermudians are emigrating or some combination of events.

All parishes except Pembroke and Paget experienced population gains between census dates. In fact, the parishes reporting increases had gains at least twice as large as the national
average of 3\%. However, the parish gains reflected not only natural increase but also some net inflow from Pembroke which recorded significant losses.

Southampton with a $19 \%$ increase recorded the largest relative gain. As a result, its share of the population rose from $7 \%$ to $9 \%$ and its rank in terms of size from the eighth to the fifth largest parish. Gains of between 13\% and 14\% were noted for St. George's and Hamilton respectively, while Smith's, Devonshire, Warwick and Sandys increased by between 7\% and 10\%.

The decrease in Pembroke continued a trend which became apparent in the decade of the fifties. Since that period, when the Pembroke population rose $8 \%$, it decreased by $3 \%$ between 1960 and 1970 and suffered an even sharper decline in the recent decade.

The movement out of Pembroke is related to the past continued exodus to less populous parishes from the eastern half of Pembroke. However the sharp reversal in Paget would appear to be more related to the net outflow of residents than from internal shifts.

TABLE (ii) - DISTRIBUTION AND RATE OF GROWTH OF POPULATION FRCM 1970-1980 - TOWN, CITY AND PARISH

| AREA | Population at Census Dates |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number |  | Percentage Distribution |  | Percentage <br> Change |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980. |
| All Bermuda | 54,050* | 52,330 | 100 | 100 | 3\% |
| Town of St. George | 1,647 | 1,604 | 3 | 3 | 3\% |
| City of Hamilton | 1,617 | 2,060 | 3 | 4 | -22\% |
| Parish (including Town and City) |  |  |  |  |  |
| St. George's | 4,587 | 4,055 | 8 | 8 | 13\% |
| Hamilton | 3,784 | 3,314 | 7 | 6 | 14\% |
| Sinith's | 4,463 | 4,158 | 8 | 8 | 7\% |
| Devonshire | 6,843 | 6,251 | 13 | 12 | 9\% |
| Pembroke | 12,060 | 13,757 | 22 | 26 | -12\% |
| Paget | 4,497 | 4,627 | 8 | 9 | -3\% |
| Warwick | 6,948 | 6,489 | 13 | 12 | 7\% |
| Southampton | 4,613 | 3,881 | 9 | 7 | 19\% |
| Sandys | 6,255 | 5,798 | 12 | 11 | 8\% |

* Population total of 54,050 excludes inmates of prisons and hospitals as well as those who did not report age or sex. (See Table 1.1 in Chapter 5.)

TABLE (iii) - HISTORIC RATES OF GROWTH OF BERMLDA'S CIVIL POPULATION -1911-1980

|  | Population at <br> End of Period <br> Number | Increase |  | Annual Rate of <br> Growth Per |
| :---: | :---: | :---: | :---: | :---: |
| Period | 18,860 | 1,133 | 6.4 | 6.2 |
| $1911-1921$ | 26,522 | 7,662 | 40.6 | 34.8 |
| $1922-1931$ | 29,547 | 3,025 | 11.4 | 13.6 |
| $1932-1939$ | 36,136 | 6,589 | 22.3 | 18.5 |
| $1940-1950$ | 42,640 | 6,504 | 18.0 | 16.7 |
| $1951-1960$ | 52,976 | 10,336 | 24.2 | 21.9 |
| $1961-1970$ | 54,670 | 1,694 | 3.2 | 3.2 |
| $1971-1980$ |  |  |  |  |

Population densities varied considerably among the parishes. Despite a decline over the decade, Pembroke continued well in front of the rest with a density per square mile of 5,743 while Hamilton Parish, with a density of 1,921 continued as the parish
with the lowest number of persons per square mile. In addition to Pembroke, only Devonshire $(3,621)$, Sandys $(3,224)$ and Warwick $(3,144)$ had densities greater than the national average of 2,922 .
table (iv) - POPulation by density and as a percentage of total - town, city AND PARISH - 1970 and 1980

| Area | Population Density per Square Mile |  | Percentage of Parish | Distribution Population | Area in Square Miles* |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980 | 1970 | 1980 |
| All Bermuda | 2,922 | 2,829 | 100 | 100 | 18.5 |
| Town of St. George | 3,108 | 3,026 | 3 | 3 | 0.53 |
| City of Hamilton | 5,989 | 7,630 | 3 | 4 | 0.27 |
| Parish (including Town and City) |  |  |  |  |  |
| St. George's | 2,048 | 1,810 | 8 | 8 | 2.24 |
| Hamilton | 1,921 | 1,682 | 7 | 6 | 1.97 |
| Smith's | 2,361 | 2,200 | 8 | 8 | 1.89 |
| Devonshire | 3,621 | 3,307 | 13 | 12 | 1.89 |
| Pembroke | 5,743 | 6,551 | 22 | 26 | 2.10 |
| Paget | 2,204 | 2,268 | 8 | 9 | 2.04 |
| Warwick | 3,144 | 2,936 | 13 | 12 | 2.21 |
| Southampton | 2,078 | 1,748 | 9 | 7 | 2.22 |
| Sandys | 3,224 | 2,989 | 12 | 11 | 1.94 |

* Source: Department of Planning

Excludes U.S. Naval Air Station 1.61 square miles and U.S. Naval Annexe 0.41 square mile.

Typical of countries experiencing low fertility, the median age of Bermuda's population increased over the decade from 25 years, 11 months in 1970 to 28 years, 10 months in 1980 and whereas in 1970 persons under 20 years of age represented $38 \%$ of the population, in 1980 their share has fallen to 31\%. (See Table v.)

Table $v$, illustrates the change in structure of the population by broad age bands between 1970 and 1980. The striking feature in the table is the marked fall in the numbers of persons under the age of 5 and between the ages of 5 to 14 . This trend first emerged in the decade of the sixties when family planning got fully underway. It is clear that this trend accelerated in the seventies as the pre-school group declined by $20 \%$ fram 4,664 to 3,733 and the primary and secondary school populations as represented by children aged 5 to 14 fell by $22 \%$ from 10,856 to 8,514. While the fall in the numbers of the latter group may to some extent reflect the incidence of overseas education, it is also undoubtedly related to the decline in fertility begun in the sixties. Certainly these marked declines among the school-age population have important implications for staff and investment in education plant.

Among the older age groups, persons aged 65 and older recorded a gain of 1,129 or $34 \%$ over the decade, thereby increasing their share of the population fram 6 percent to 8 percent. Needless to say, this event implies vastly increased expenditure on the care of the aged by both private households and the national goverrment.

All other age groups in the interval 15 to 64 recorded increases of from $10 \%$ to 13\%. (Thus it can be inferred that the potential labour force grew faster than the population, creating the potential for improved living standards assuming full employment and constant or higher labour force participation rates.)

The age/sex structure of the population is also worthy of brief comment, particularly with respect to its implications for the labour force and fertility. With respect to the labour force, the increases shown for females aged 15-29 and 30-34 are substantially larger than that for males both in absolute and percentage terms. This finding implies much greater pressure on the labour market for jobs by women than by men in the coming decade.

By the same token, the fact that women in the child-bearing age groups have recorded an increase over the decade substantial-
ly greater than the national average suggests that there will be
some increases in the annual number of children born over the coming decade, assuming of course that continued declines in fertility does not offset this trend.

TABLE (v) - DISTRIBUTION OF POPULATION BY SEX AND SELECTED AGE GROUPS - 1980 AND 1970

| AGE GROUP | Population at Census Date |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number |  | Percentage Distribution |  | Percentage Change |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| Both Sexes | 54,050 | 52,330 | 100 | 100 | 3\% |
| Under 5 | 3,733 | 4,664 | 7 | 9 | -20\% |
| 5-14 | 8,514 | 10,856 | 16 | 21 | -22\% |
| 15-29 | 14,886 | 13,500 | 28 | 26 | 10\% |
| 30-44 | 12,014 | 10,706 | 22 | 20 | 12\% |
| 45-64 | 10,432 | 9,262 | 19 | 18 | 13\% |
| 65 and Over | 4,471 | 3,342 | 8 | 6 | 34\% |
| MALES | 26,350 | 26,293 | 100 | 100 | 0 |
| Under 5 | 1,862 | 2,405 | 7 | 9 | -23\% |
| 5-14 | 4,362 | 5,375 | 17 | 20 | -19\% |
| 15-29 | 7,299 | 7,004 | 28 | 27 | 4\% |
| 30-44 | 6,001 | 5,567 | 23 | 21 | 8\% |
| 45-64 | 5,003 | 4,538 | 19 | 17 | 10\% |
| 65 and Over | 1,823 | 1,404 | 7 | 5 | 30\% |
| FEMALES | 27,700 | 26,037 | 100 | 100 | 6\% |
| Under 5 | 1,871 | 2,259 | 7 | 9 | -17\% |
| 5-14 | 4,152 | 5,481 | 15 | 21 | -24\% |
| 15-29 | 7,587 | 6,496 | 27 | 25 | 17\% |
| 30-44 | 6,013 | 5,139 | 22 | 20 | 17\% |
| 45-64 | 5,429 | 4,724 | 20 | 18 | 15\% |
| 65 and Over | 2,648 | 1,938 | 10 | 7 | 37\% |

The racial composition of the civilian population in 1980 was 33,158 black (61\%) and 20,892 white and other races (39\%). In 1970 comparable praportions were $59 \%$ black and $41 \%$ white and other races.

Viewed in terms of nativity, the Bermuda-born population at 39,880 was up only 2,046 or $5 \%$ over the decade indicating a substantial out-migration since it has already been noted that the balance of births and deaths was 4,800. In addition, foreign-born residents decreased by 326 or $2 \%$ during the same period, thereby reinforcing the trend towards population stabilisation.

> TABLE (vi) - DISTRIBUTION AND RATE OF GROWTH OF POPULATION CLASSIFIED BY RACE AND NATIVITY - 1980 AND 1970

|  | Population at Census Dates |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: | :---: |
| RACE <br> and | Percentage <br> Nistribution |  |  |  | Percentage <br> Change |
| NATIVITY | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Bermuda | 54,050 | 52,330 | 100 | 100 | $3 \%$ |
| Black | 33,158 | 30,897 | 61 | 59 | $7 \%$ |
| White and Other | 20,892 | 21,433 | 39 | 41 | $-3 \%$ |
| Bermuda Born | 39,880 | 37,834 | 74 | 72 | $5 \%$ |
| Black | 30,722 | 28,707 | 57 | 55 | $7 \%$ |
| White and Other | 9,158 | 9,127 | 17 | 17 | 0 |
| Foreign Born | 14,170 | 14,496 | 26 | 28 | $-2 \%$ |
| Black | 2,436 | 2,190 | 5 | 4 | $11 \%$ |
| White and Other | 11,734 | 12,306 | 22 | 24 | $-5 \%$ |

The main country of origin of the foreign born was the United Kingdom with 34\% followed by the United States with 20\% and Azores/Portugal with $12 \%$. Canada and the Commonweal th Caribbean each contributed $10 \%$.

Given the overall decline in the size of the foreign-born population, it comes as no surprise that three of the countries of origin sent fewer people to reside here than in the previous decade (see Table vii). In fact, only the foreign-born residents from Canada and the United States increased their numbers since 1970, and this resulted to some extent from the inclusion of previously excluded Armed Forces Personnel living off bases in the resident population count.

TABLE (vii) - DISTRIBUTION AND RATE OF CROWTH OF FOREIGN-BORN POPULATION BY COUNTRY OF ORIGIN - 1980 AND 1970

| Country or Region of Origin | Foreign-Born Population |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number |  | Percentage Distribution |  | Percentage Change |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Foreign Bom | 14,170 | 14,496 | 100 | 100 | -2\% |
| United Kingdan | 4,840 | 5,234 | 34 | 36 | 8\% |
| Canada | 1,421 | 1,221 | 10 | 8 | 16\% |
| Commonweal th |  |  |  |  |  |
| Carribbean | 1,419 | 1,621 | 10 | 11 | -12\% |
| United States | 2,795 | 2,363 | 20 | 16 | 18\% |
| Azores/Portugal | 1,759 | 2,350 | 12 | 16 | -25\% |
| Other and Not Stated | 1,935 | 1,707 | 14 | 12 | 13\% |

It is well to point out here that the foreign born are not to be equated as non-Bermudians. Many of the foreign born have acquired Bermuda Status either by grant or through marriage. This is revealed in special tabulations on nativity and citizenship not included in this volume but scheduled to be made available in due course. These information sources indicate that 68\% of the foreign born are without Bermuda status, roughly the same proportion as in 1970.

One of the explanations for the high proportion of the foreign born who are without Bermuda Status is the high turnover rates for this group of residents. Again, information contained in tabulations not included in this set point out that some 40\% of the foreign born have resided in Bermuda for 5 years or less, the minimum time necessary to apply for status. In addition, over 40\% are citizens of non-Commonwealth countries and are, therefore, not eligible for citizenship without first becoming naturalised as British Subjects.

## RELIGION

The religious denomination with the largest number of adherents continues to be the Church of England. In fact, despite a significant decline in the number claiming to follow
that faith, the reported figure of 20,163 in May 1980 was substantially greater than the 7,458 reported for the next largest denamination, the Raman Catholic Church. (See Table ix.)

In addition to the above named churches, the African Methodist Episcopal and the Methodists continue their claim to being among the four largest denominations in Bermuda. However, all four experienced declines in their share of persons claiming these faiths.

Significant gains in adherents were experienced for the Seventh Day Adventist, Pentecostal and Church of God denominations. Also of importance is the emergence of new religious groups as indicated by the marked growth in the Other, None and Not Stated Group.

The increases in what is often termed the fundamentalist Christian faiths as well as the emergence of non-Christian faiths and cults have been reported widely in the United States over the past decade. In anticipation that such trends would emerge in Bermuda, tabulations have been prepared by which the demographic economic and housing characteristics of the population within broad categories of religions have been prepared. It is expected that these reports will be of immense interest to institutions
and individuals whose concern is the spiritual well-being of the community as well as to those interested in the influence of religious attitudes on fertility.

TABLE (viii)- DISTRIBUTION AND RATE OF GROWTH OF MAJOR RELIGIOUS DENOMINATIONS AT CENSUS DATES - 1980 AND 1970

|  | Major Religious Groups |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number |  | Percentage Distribution |  | Percentage Change |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Denominations | 54,050 | 52,330 | 100 | 100 | 3\% |
| Church of England | 20,163 | 23,687 | 37 | 45 | -15\% |
| Roman Catholic | 7,458 | 7,629 | 14 | 15 | -2\% |
| African Methodist |  |  |  |  |  |
| Episcopal | 5,531 | 5,503 | 10 | 11 | 1\% |
| Methodist | 3,306 | 3,591 | 6 | 7 | -8\% |
| Seventh Day |  | , |  |  |  |
| Adventist | 2,731 | 1,861 | 5 | 4 | 47\% |
| Presbyterian/ |  |  |  |  |  |
| Congregational | 1,783 | 1,759 | 3 | 3 | 1\% |
| Pentecostal | 1,774 | 1,245 | 3 | 2 | 42\% |
| Salvation Amy | 1,135 | na | 2 | na | ra |
| Brethren | 1,094 | 1,093 | 2 | 2 | 0\% |
| Church of God | 896 | 701 | 2 | 1 | 28\% |
| Baptist | 740 | 668 | 1 | 1 | 11\% |
| Other, None and Not Stated | 7,439 | 4,593 | 14 | 9 | 62\% |

## FERTILITY

It was noted in chapter three that fertility is the actual bearing of children by women as they pass through the child-
bearing age $15-44$ years. Also noted was that the type of union which resulted in children is an important deteminant of risk of pregnancy. Census 80 deals extensively with fertility and some of the key findings are highlighted below.

In the discussion of the age structure of the population, it was noted that the number of women aged 15-44 increased significantly between 1970 and 9980 to the extent that their relative share in the population stood at $50 \%$, up 4 percentage points from their 1970 proportion of $46 \%$.

The question arises, what are the implications of this increase for population growth? Does more fertile women mean more children and a reversal of past trends in falling birth rates? While explicit answers to these questions must await further study the following facts are of interest.

Table (ix) provides summary statistics of the child-bearing activity for broad ages of women. Notably, although the number of women rises substantially over the decade, the number of children born to all women increases by only 1\%. Thus, the average number of children born per 1,000 wanen falls from 2,119 to 1,854 . The fall in average children per woman is even more marked in the child-bearing age group where lower average
children per woman more than offset increasing averages for women whose fertility cycle has ended. Nor is this phenamenon explained by higher numbers of women with no children. The 1980 findings reveal that women who have borne at least one child-designated mothers--also record a decline in the average number of children. Further, for mothers of all ages, the averages fell.

An important factor in determining the probability that a woman will have a child is the probability of her proximity to
a mate. Thus, married women can be expected to be at greater risk than unmarried women, improved contraceptive techniques notwithstanding. Table ( $\times 1$ ) summarises the union status of wamen aged 15 to 64 not attending school. The key finding is that since 1970 relatively more women have opted for a life unattached to a male, a factor which would reinforce the falling fertility rates noted earlier.

TABLE (ix) - SUMMARY MEASURES FOR ALL WOMEN (1) AGED 15 TO 64 NDT ATTENDING SCHOOL AND ALL CHILDREN BORN TO THESE WOMEN FOR SELECTED AGE GROUPS - 1980 AND 1970 COMPARED

| Age Group | All | Women | All Women With Children |  | All Children Ever Born to Women |  | Mothers per 1,000 Women |  | Children per 1,000 Women |  | Children per <br> 1,000 Mothers |  |

(1) Excludes women who did not state whether or not they had children.
(2) Data for 1970 were derived from Volume 8, Fertility, 1970 Population Census of the Cormonwealth Caribbean.

Table ( $x$ ) shows that since 1970 the proportion of women married and living with their husbands has fallen from $63 \%$ to 55\%. Further, those who no longer live with their husbands or who never have had a husband or partner have increased as a percentage of the population.

Of special significance is the increase in the women categorised as "Other". Most of these wamen were reported as
being in common-law relationships and, as a group, they have shown a marked rise.

Much of the trend against marriage reflects behaviour patterns of women of child-bearing age. In 1970, 59\% of these women reported they were married and living with their husbands. Since 1970, many of these women have exited from the 15 to 44 group and have been replaced by a younger group who show more reluctance either to enter into or remain in the married state.

TABLE (x) - DISTRIBUTION OF WOMEN NDT ATTENDING SCHOOL IN SELECTED AGE GROUPS BY UNION STATUS AT THE TIME OF CENSUS OR AT AGE 45-1980 AND 1970

| Age Group |  | All Women |  | Married |  | No Longer Living With Husband |  | Never Had Husband or Partner |  | Other |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | No. | \% | No. | \% | No. | \% | No. | \% | No. | \% |
| 1980 | All Women | 20,525 | 100 | 11,347 | 55 | 2,642 | 13 | 4,839 | 24 | 1,697 | 8 |
|  | 15-44 years | 12,451 | 100 | 5,949 | 48 | 1,234 | 10 | 4,018 | 32 | 1,250 | 10 |
|  | 45 years and over | 8,074 | 100 | 5,398 | 67 | 1,408 | 17 | 821 | 10 | 447 | 6 |
| 1970 | All women | 280 | 100 | 10,836 | 63 | 2,060 | 12 | 3,681 | 21 | 703 | 4 |
|  | 15-44 years | 10,633 | 100 | 6,313 | 59 | 830 | 8 | 2,926 | 28 | 564 | 5 |
|  | 45 years and over | 6,647 | 100 | 4,523 | 68 | 1,230 | 19 | 755 | 11 | 139 | 2 |

Data for 1970 were derived from Volume 8, Union Status, 1970 Population Census of the Cammonwealth Caribbean.

Further insight on the reasons for declining fertility are obtained from the tabulations of age of mothers at the birth of their first and last live-born ohild. According to Table (xi), it would appear that the age of mothers at the birth of first live-born child has not changed. Further, the age at birth of last live-born child has fallen only marginally. (See Tables xil and xiii.)

In 1980 the proportion of women who had live births before the age of 20 declined slightly by one percentage point. However, the median age of mothers at the initial live birth was unchanged from 1970 at 21.8 . These data suggest that fertility has been relatively unaffected by changes in the age for commencing child-bearing.

When the age at birth of last live-born child is considered, the data point to a slightly lower median age for ceasing childbearing activity. It may be concluded therefore that a summary inspection of the fertility tabulations do not indicate a significant impact on child-bearing due to variations in the ages at which women begin and end their child-bearing cycle.

The object here is merely to note some of the more obvious trends in fertility. More definitive statements must await a full analysis of fertility tabulations included in this publication as well as a consideration of the influence of race, nativity and religion in future studies devoted to this topic.

```

```

$\left.\begin{array}{lccc}\hline & & \text { Median Age }\end{array}\right]$|  | Age at Birth <br> of First <br> Live-born Child | Age at Birth <br> of Live-born Child |
| :---: | :---: | :---: |
| Census Date | Total Mothers | 27.7 |
| 1980 | 12,100 | 21.8 |

TABLE (xii) - FEMALE POPULATION AGED 15-64 NOT ATTENDING SCHOOL BY AGE OF MOTHER AT BIRTH OF FIRST LIVE-BORN CHILD - 1980 AND 1970

| Mothers Age at First Live birth | Number |  | Percentage Distribution |  | Percentage Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980\% | 1970\% | 1970/1980 |
| Total | 17,880 | 15,355 | 100 | 100 | 16\% |
| Under 20 | 4,410 | 3,933 | 25 | 26 | 12\% |
| 20-24 | 4,453 | 4, 103 | 25 | 27 | 9\% |
| 25-29 | 2,257 | 1,916 | 13 | 12 | 18\% |
| 30-34 | 752 | 686 | 4 | 4 | 10\% |
| 35-39 | 194 | 222 | 1 | 2 | -13\% |
| 40-44 | 39 | 38 | 0 | 0 | 3\% |
| 45 or older | 0 | 0 | 0 | 0 | $0 \%$ |
| Not applicable | 5,775 | 4,455 | 32 | 29 | 30\% |

TABLE (xiii) - FEMALE POPULATION ACED 15-64 NOT ATTENDING SCHOOL. BY ACE OF MOTHER AT BIRTH OF LAST LIVE-BORN CHILD - 1980 AND 1970

| Mothers Age at Last Live birth | Number |  | Percentage Distribution |  | Percentage Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980\% | 1970\% | 1980/1970 |
| Total | 17,880 | 15,355 | 100 | 100 | 16\% |
| Under 20 | 1,280 | 1,090 | 7 | 7 | 17\% |
| 20-24 | 2,850 | 2,582 | 16 | 17 | 10\% |
| 25-29 | 3,453 | 2,938 | 19 | 19 | 18\% |
| 30-34 | 2,671 | 2,322 | 15 | 15 | 15\% |
| 35-39 | 1,279 | 1,402 | 7 | 9 | -9\% |
| 40-44 | 384 | 509 | 2 | 3 | -25\% |
| 45 or older | 39 | 57 | 0 | 0 | -32\% |
| Not applicable | 5,924 | 4,455 | 33 | 29 | 33\% |

What is strongly indicated at this point is that fertility rates are continuing to fall, and this fall seems likely to offset the impact of substantial increases in the numbers of women of child-bearing ages. This finding deserves additional study since future trends in births have important implication not only for education policy but for economic policy, since changes in fertility levels influence the number of women who will be working in the coming decade and the kind of work they will do.

## EDUCATION

The 1980 Census looks in depth at education for its own sake and also for its influence on other population characteristics. This section looks at educational attalnment in terms of the highest level of institution attended as well as the highest exam passed at the secondary level or higher.

Table (xiv) indicates that between 1970 and 1980 , the proportion of the population aged 5 or older who had attended a college or university had risen from $5 \%$ to $16 \%$. In tems of actual numbers, this was an increase of from 2,322 to 8,036--a substantial gain.

TABLE (xiv) - DISTRIBUTION OF POPULATION ACED 5 OR OLOER BY SEX AND HIGHEST LEVEL OF EDUCATIONAL ATTAINENT

| Highest Level of Educational Attaiment | Population Age 5 or Older |  |  | Percentage Distribution |  |  |

| Other and | 468 | 225 | 243 | 1 | 1 | 1 |

(1) All references to Bermuda College in the Chapter 5 tabulations include any other colleges as well.
(2) Data for 1970 were derived from Volume 6, Part 3, 1970 Population Census of the Commonwealth Caribbean.

Table (xv), which looks only at the population not attending school, shows that of those who had attended college or university, 6,494 obtained a diplama or a degree compared with 2,213 in 1970. Thus by 1980, 17\% of Bermuda's adult population had
obtained a degree or diploma compared with $6 \%$ a decade ago. Clearly Bermudians are meeting the challenge of preparing themselves for the increased skill requirements currently demanded.

## Introduction

The impact of changes in the economy of Bermuda on the labour force can now be measured with reasonable precision since both the 1970 and 1980 censuses utilised the Standard Industrial Classification System (S.I.C.) to categorise economic activity. However, because the S.I.C. system used for 1980 was a revised version of that used in 1970, same adjustment had to be made to the 1970 figures to ensure consistency.

Similar considerations forced an adjustment to the grouping of occupations used in 1970 to ensure comparability with the Bermuda Classification of Occupation. The major adjustment here was to reclassify managers in retail, wholesale, and catering industries to the occupational group, "Administrators and Managers".

However, no adjustment was made to the 1970 figures to take account of the fact that the definition of the labour force and components used for Census 80 is based upon a reference period of one week and not 12 months as in 1970. Despite these crude modifications to the 1970 data, it was possible to reveal the fundamental changes taking place in the size and composition of Bermuda's labour force with a high degree of accuracy.

## Economically Active Population

As implied by the analysis of population change over the decade, the growth of Bermuda's econamically active population reflected the increases noted in the resident population aged 15 years or older. Although the population used in the analysis of the labour force for 1980 is slightly different from that used for 1970 (including only persons aged 16 years old and not attending primary or secondary school), it was not expected to behave any differently than did the somewhat larger group. This expectation was realised since the population not attending primary or secondary school increased by 4,570 or $13 \%$ over the decade, a change similar to that for the larger population.

The economically active population is so defined because it is based upon the main activity of respondents during the 12 months prior to the enumeration date as was the 1970 data. Thus, the economically active population consists of persons who worked or looked for work or were available for work.

The economically active population increased by 3,353 or $12 \%$ between 1970 and 1980 to 30,889 . This advance was slightly smaller than that recorded for the entire adult population and, as a result, the percentage of economically active people in the adult population fell slightly. (See Table xvi.)

The increase in the economically active population resulted from an increase of $11 \%$ in the number of persons who worked and an almost threefold increase in the ranks of those who looked for work. As a result, job seekers increased their relative share of the adult population at the expense of the working members.

When sex is considered, changes over the decade are quite dramatic. The number of men in the work-force rose by only 404 or $2 \%$, even though the number of adult males rose by 1,444 or 8\%. As a result, the proportion of males economically active fell from 94\% in 1970 to $89 \%$ in 1980.

As a consequence of the relatively slow growth of the number of males economically active, the proporton of employed males in the male population fell from 93\% to 87\%. However, the proportion of those unemployed doubled.

On the other hand, women reported as economically active increased by 2,949 or $27 \%$ over the decade. This growth was relatively greater than that recorded for all adult women. As a result, the proportion of women economically active rose 5 full percentage points to 68\% from 1970 to 1980.

It is important to note that the significant gains in labour force participation for women indicate that not only were more women avallable for work, but also that significant numbers opted to become economically active in preference to the more traditional role of home duties. To the extent that this influence is true, it follows that the increased desire of women to participate in the work-force will reinforce already ingrained attitudes toward smaller families and suggests that low fertility levels will be a continuing feature of Bermuda's demographic profile in the imediate future.

TABLE (xvi) - DISTRIBUTION OF POPULATION NOT ATTENDING SCHOOL (PRIMARY/SECONDARY) BY SEX AND BY ECONOMIC ACTIVITY - 1970 AND 1980*

| Economic Activity | Population Aged 16 Years and Over |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number |  | Percentage Distribution |  | Percentage Change |
|  | 1980 | 1970 (1) | 1980 | 1970 (i) | 1980 to 1970 (1) |
| Both Sexes | 39,549 | 34,979 | 100 | 100 | 13\% |
| Economically Active | 30,889 (2) | 27,536 | 78 | 79 | 12\% |
| Worked | 30,282 | 27,271 | 77 | 78 | 11\% |
| Looked for Work | 607 | 265 | 2 | 1 | 129\% |
| Not Economically Active | 8,660 | 7,443 | 22 | 21 | 16\% |
| Males | 19,050 | 17,606 | 100 | 100 | 8\% |
| Economically Active | 16,930 | 16,526 | 89 | 94 | 2\% |
| Worked | 16,619 | 16,369 | 87 | 93 | 2\% |
| Looked for Work | 311 | 157 | 2 | 1 | 98\% |
| Not Economically Active | 2,120 | 1,080 | 11 | 6 | 96\% |
| Females | 20,499 | 17,373 | 100 | 100 | 18\% |
| Econamically Active | 13,959 | 11,010 | 68 | 63 | 27\% |
| Worked | 13,663 | 10,902 | 67 | 63 | 25\% |
| Looked for Work | 296 | 108 | 1 | 1 | 174\% |
| Not Economically Active | 6,540 | 6,363 | 32 | 37 | 3\% |

(1) Original figures for 1970 referred to population aged 14 years and over. These figures have been adjusted to bring them in line with the 1980 totals.
(2) This figure becomes 31,436 when the definition of "economically active" is based on one week rather than one year. (See Table xvii on following page.)

## Trends in Labour Force

Bermuda's labour porce includes only those people who worked or looked for work during the week prior to enumeration. In this respect it differs in concept to the economically active population which is defined in terms of what a person did during most of the year. Only persons who qualified as members of the labour force were required to provide information on work status, occupation, industry, and hours worked. A report of the key findings follows. (See Table xvil.)

Bermuda's labour force numbers 31,436 in 1980 up 4,117 or 15\% over 1970. The increase reflected a rise of 3,287 in the number of women employed as against an increase of only 830 in the number of men.

Overall, 81\% of the work-force was engaged a full year, a proportion which was unchanged from 1970. Typically, relatively more men than women worked a full year. However, the proportion of women engaged a full year rose by 3 percentage points to $79 \%$, while that for men fell slightly by 1 percentage point to 83\%.

TABLE (xvii) - LABOUR FORCE BY SEX AND NMBER OF MONTHS WORKED OURING 12 MONTHS PRECEDING CENSUS

| Not Stated | - | - | - | - | - | - |

The 1980 figures show a shift in the occupational status of the work-force towards increased employment by government. Persons employed by government increased 45\% over the decade, thereby increasing government's share of the work-force from $12 \%$
to 15\%. Both men and women shared in this shift to the same extent.

The gains recorded by government were at the expense of employment by non-government institutions, a phenomenon reported for both men and women at approximately the same rate.

TABLE (xviii) - LABOUR FORCE BY SEX AND TYPE OF WORKER

| Occupational Status | Labour Force 1980 |  |  |  |  |  |

| Not Stated | 54 | 1 | 19 | 0 | 37 | 0 |

The increased labour supply was absorbed by expanding employment opportunities in all service industries except personal and household services which declined. In fact, job creation in the expanding industries was sufficiently large to utilise workers released from those industries showing reduced employment levels.

Although virtually all the service industries experienced marked advances in employment, the most important gains occurred in hotels, restaurants and clubs; this category increased its share of the work-force by 2 percentage points. Other industries substantially increasing their share of the work-force were public administration and defence, other community/social services, education, health and international companies, although the extent to which the last group expanded is unknown since no special classification existed for it in 1970.

Of the industries experiencing decilnes in relative strength, personal and household services was down 5 percentage points to $7 \%$ of the work-force and construction was lower by 4 percentage points to $9 \%$ of the work-force.

TABLE $(x I X)$ - LABOUR FORCE EY MAJOR INOUSTRIAL GROUP 1970 AND 1980

| Industrial Group (1) | Number |  | Percentage Distribution |  | Percentage <br> Change1970 to 1980 |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980 | 1970 |  |
| ALL BERMLDA | 31,436 | 27,319 | 100 | 100 |  |
| Agriculture, Fishing and Quarrying | 402 | 431 | 1 | 2 | -7\% |

| Other Classifications | 1,307 | 270 | 4 | 1 | 384\% |

(1) See following page
(1) The 1970 information displayed in Table xix had to be modified from the original to take into account changed industrial classifications in 1980. These changes involved the following industry groups:

## Manufacturing

Electricity, gas and water
Other community/social services
Personal and household services
Other classifications

Two sets of data were used from the Bermuda Census Report; these were Table 30--Detailed Industrial Tabulation--and Table 35c.

As far as was feasible the control totals for the industrial groupings were derived from Table 35c. Finer breakdowns were obtained from Table 30.

The total for manufacturing was obtained by removing the following industry sub-groups (see Table 30 ).

Manufacture of machinery products and repairs (148).
Manufacture of transports equipment and repairs (574).
Miscellaneous manufacturing industries and repairs (57) i.e., 1,760 from Table 35c and 779 fram Table 30.

The total for electricity, gas and water was obtained by removing sanitation services (30) from the total in 35 c . Other community/social services was the sum of non-profit institutions (320) and sanitation services (30), both from Table 30.

Personal and household services included personal services (2,062), miscellaneous services (302), and the total of the repairs industries previously included under manufacturing (779).

In addition, 23 employees from other industry groups were added as a balancing item.

The total for other classifications and not stated (270) was repeated from Table 35c. All other industry groups were repeated unmodified from Table 30.

Since industrial expansion or decline determines the demand for particular types of workers, it follows that those occupations which are used in relatively high proportion by expanding industries will themselves expand. Accordingly, the number of professional, technical, administrative, managerial and clerical workers required increased in response to the demand in the service industries. Thus in 1980 these groups of workers accounted for $43 \%$ of the labour force compared with $38 \%$ in 1970. (See Table xx.)

All other occupational groups lost ground in 1980 with respect to their share of the work-force even though only production and related workers actually reported fewer numbers than in 1970. Sales and service workers both suffered declining shares of the labour market despite expansion in the trade, hotel and restaurant industries.

The most important decline occurred among production and related workers who bore the brunt of the declining importance of manufacturing, construction, and transport and storage industries

- as a source of employment.

TABLE (xx) - LABOUR FORCE BY OCCIPATIONAL GROUP

| Occupational Group (1) | Economically Active Population |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Number |  | Percentage Distribution |  | Percentage Change |
|  | 1980 | 1970 | 1980 | 1970 | 1980 to 1970 |
| All Occupations | 31,436 | 27,319 | 100 | 100 | 15\% |
| Professional, Technical and Related Workers | 4,643 | 3,603 | 15 | 13 | 29\% |
| Acministrative and Managerial | 2,587 | 1,994 | 8 | 7 | 30\% |
| Clerical and Related | 6,219 | 4,702 | 20 | 17 | 32\% |
| Sales Workers | 1,999 | 1,866 | 6 | 7 | 7\% |
| Service Workers | 7,030 | 6,170 | 22 | 23 | 14\% |
| Production and Related Workers, Transport |  |  |  |  |  |
| Equipment Operators | 6,111 | 7,107 | 19 | 26 | -14\% |
| All Other Occupations | 2,847 | 1,877 | 9 | 7 | 52\% |

(1) See following page.

It is planned at some later stage of analysis of the census findings to look in depth at the implications of the overall changes in the econamy for various population sub-groups such as blacks, whites, foreign born, citizens and so on. However, in 1970 some comments were made about the distribution of occupational groups by race and nativity and this discussion is repeated below.

Comparisons of the data for major occupational groups by race and nativity for 1980 with 1970 data adjusted for definitional changes reveals that the rise in the work-force over the decade took place almost entirely among blacks and the
(1) It was necessary to modify the information displayed in Table $x x$ to take into account changed occupational classifications introduced by the Bermuda System of Dccupational Classifications. Wherever possible control totals were obtained from Table 35b in the Bermuda Report of the 1970 Census and occupational detail were obtained from Table 29 of that same publication.

Occupational Groups affected were the following:

> Aministrative and Managerial Sales Workers
> Service Workers
> Production, Processing and Related Workers
> All Other Classifications

To the total of 982 for managers and administrators in Table 35 b was added the following groups of managers reported in Table 29:

| From sales workers: |  |
| :---: | :---: |
| - Managers in wholesale and retail trade | 412 |
| - Working proprietors, wholesale and retail trade | 231 |
| From service workers: |  |
| - Managers, catering and lodging services | 234 |
| - Working proprietors, catering and lodging services | 126 |
| From agricultural workers: |  |
| - Farm managers | 9 |
| Total | 1,012 |

The total for sales workers in Table $35 b(2,509)$ was reduced by the total for the two sets of workers transferred to the adninistrative and managerial group (643).

The total for service workers in Table 35 ( 6,530 ) was reduced by the total for the two sets of workers transferred to the Anistrative and managerial group (360).

To the total for production, processing and related workers in Table 35b was added the total for workers in transport and conmunications (215).

All other occupational classifications in Table 35b were combined to form the final grow - all other classifications.

Bermuda born. As a result both categories of the population increased their share of total jobs. (See Tables xxi and xxii.)

The share of jobs held by blacks in all occupational groups rose over the decade. However, the most important gains in terms of earning power were in the professional, technical, administrative and managerial positions. Blacks' share of jobs in these categories rose by 6 percentage points for the former and 7 percentage points for the latter. Despite these gains, however, the share of white collar occupations held by blacks did not approach their share of total jobs except in the case of clerical and related positions.

In the face of the gains made by blacks, the share of whites in all major occupational groups fell with the largest decrease occurring in the clerical and sales occupations. However, although significant decreases were reported for professional, technical and management positions, whites still dominated these positions with $62 \%$ and $69 \%$ respectively of jobs in these categories.

When occupations are analysed by nativity, it is apparent that the Bermuda born accounted for all of the increase in the
work-force since 1970 and improved their share of jobs in all categories except sales workers. (See Table $\times x i 1$ ).

As noted for blacks, the Bermuda born recorded their largest gains in the clerical and related positions. However, unlike blacks, the Bemuda born experienced a decrease in their share of sales positions.

The Bermuda born also made significant advances in the professional, technical and related field but are yet to match the share of these positions held by the foreign born.

The Bermuda born are gradually becoming daminant in the administrative and managerial fields with $59 \%$ of these positions held in 1980 as against $55 \%$ in 1970. However, in this case their present share of these jobs is substantially below their share of the work-force of 71\%.

TABLE (xxi) - LABOUR FORCE BY OCCUPATIONAL GROUP AND RACE - 1970 AND 1980 (1)

| Occupational Group | Labour Force by Race$1980$ |  |  | Labour Force by Race 1970 |  |  | Percentage Change 1970 to 1980 |  |  |

(1) Adjustment of the occupational classifications for all Bermuda, made necessary similar adjustments for the classifications by race and nativity (Tables xxi and xxii). For both sets of data the adjustments involved modifications of the reported totals in Tables 360 and 39 b of the Bermuda Report of the 1970 Population Census. The adjustments involved the following occupational groups:

```
Administrative and managerial
Sales workers
Clerical workers
All other occupations
```

In the previous note on occupational classifications it will be recalled that the administrative and managerial group were augnented by 643 managers previously classified as sales workers, 260 managers previously classified as service workers and 9 managers previously classified as farm workers.

Using the proportion of blacks in the managerial group prior to adjustment ( 0.2393 ), these three groups of workers were split as follows:

```
Managers, wholesale and retail - }154\mathrm{ black, 489 white.
Managers, catering and lodging - 86 black, 274 white.
Farm managers - 2 black, }9\mathrm{ white.
```

These modified totals were added to and subtracted from the major occupational groups as appropriate.

Using the proportion of foreign born in the managerial group prior to adjustment ( 0.4684 ), the above occupational sub-groups of workers were split as follows:

Managers, wholesale and retails - 301 foreign born and 342 Bermuda born.<br>Managers, catering and lodging services - 169 foreign born and 191 Bermuda born.<br>Farm managers - 4 foreign born and 5 Bermuda born

These sets of adjustments have introduced some error in the race and nativity breakdowns affected in the 1970 figures. The error is expected to have greatest impact on the estimates of percentage change for the following occupational groups: administrative and managerial, sales workers, and service workers. Except for sales workers, the impact on the distribution of these workers should be minimal.

For sales workers, the removal of managers in catering and lodging services imparted substantially on the total of foreign workers in this category.

The foregoing analysis is intended to point the way to more fruitful areas of investigation as the census results are studied in depth. Thus, the observation that women are beconing of increased importance as a component of the labour force has important implications for manpower planning as does the continued expansion of the service and catering sectors of the economy. Further, there is evidence that blacks are participating more at the decision making level in the econamy, although the extent of this participation is considerably below that which their overall share of the work-force would suggest. Similar considerations apply for the Bermuda born although the proportion of the decision making positions held are substantially higher, indicating that Bermuda-born whites are more successful in acquiring these positions than are blacks. Certainly the variations noted for'women, blacks, and the Bermuda born are of sufficient importance to warrant an intensive study at the earliest opportunity.

Internal migrants have been defined as Bermuda-born residents who on Census Day declared their parish of birth as other than that in which they reside. Information on internal migrants enables planners to anticipate the size and direction of internal movements of the population.

Data on internal migrants was collected for the first time in 1970. Hence 1980 provides the first opportunity to make real use of this information. No attempt will be made here to analyse this information other than to note the direction of major population movements. In order to achleve this, parishes have been grouped as Eastern (St. George's, Hamilton and Smith's), Central (Devonshire, Pembroke and Paget), and Western (Warwick, Southampton and Sandys). In so doing we have reduced the total of internal migrants substantially in both periods since shifts in adjacent parishes constitute a move only when such a shift is equivalent to moving into a different region. (See Table xxili.)

When internal migration is viewed on a regional basis, it turns out that 12,352 out of a total of 39,880 or $31 \%$ of the Bermuda-born population were internal migrants. In 1970, internal migrants defined regionally were $26 \%$ of the population.

Although the proportion of the population classified as internal migrants rose in 1980, the direction and relative size of the movement did not change substantially. The Western parishes with $42 \%$ of the internal migrants continued to be the major gainer followed by the Central parishes. However, the percentages of internal migrants' moving to the Eastern parishes increased by 3 percentage points to close on the Central parishes as a final stopping place for internal migrants.

Most internal migrants (55\%) originate in the Central
parishes. In fact this proportion continues unchanged from 1970. Significantly, the Eastern parishes have been increasing their share of internal migrants at the expense of the Central and Western parishes.

These findings suggest that the Eastern parishes may be on the verge of entering into the kind of population expansion which occurred in the Western parishes over the past decade. Should further study confirm this trend, there are important implications for land use and business strategic planning.

TABLE (xxiii) - ALL INTERNAL MIGRANTS BY REGION OF BIRTH AND REGION OF RESIDENCE 1980 AND 1970

|  | Internal Migrants by Region of Birth |  |  |  | Regional Totals as a Percentage of Total Internal Migrants |  |  |  |

| Eastern Region | 2,343 | - | 1,861 | 482 | 24 | - | 19 | 5 |
| Central Region | 3,196 | 1,495 | - | 1,701 | 32 | 15 | - | 17 |
| Western Region | 4,410 | 799 | 3,611 | - | 44 | 8 | 36 | - |

## HOUSEHOLDS

In 1980 Bermuda's households numbered 18,449, up 2,865 or 18\% from 1970. All households with from one to four persons shared in the general rise to the extent that each size household increased its share of total housing except 3-person households which retained the same share. (See Table xxiv.)

The most substantial increases occurred amongst singleperson households whose share of total households advanced 6 percentage points to 25\% of all households. Households larger than 4 persons experienced a substantial drop in importance from 23\% of all households in 1970 to $13 \%$ in 1980.

TABLE (xxiv) - HOUSEHOLDS BY NLMBER OF PERSONS PER DWELLING 1980 AND 1970

| Persons per Dwelling | Number |  | Percentage Distribution |  | Percentage Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Bermuda | 18,449 | 15,584 | 100 | 100 | 18\% |
| 1 Person | 4,529 | 2,953 | 25 | 19 | 53\% |
| 2 Persons | 4,973 | 3,861 | 27 | 25 | 29\% |
| 3 Persons | 3,387 | 2,741 | 18 | 18 | 24\% |
| 4 Persons | 2,999 | 2,400 | 16 | 15 | 25\% |
| 5 Persons | 1,369 | 1,565 | 7 | 10 | -13\% |
| 6 or More Persons | 1,192 | 2,064 | 6 | 13 | -42\% |

Associated with the tendency for househoids to be small was a shift towards occupying smaller dwellings. Households living in dwellings of two rooms or less increased by over 50\% over the decade. As a result, these kinds of households rose from 18\% to 23\% of the total. (See Table xxv.)

Households occupying dwellings with 3 or more rooms also increased in number but not at the same rate as the households living in small owellings. Since all categories of this type of household either experienced no ctiange in their numbers or declined over the decade, their share of the housing market declined substantially.

## TABLE (xxv) - HOUSEHOLDS BY NLNBER OF ROOMS IN OWELLING 1980 AND 1970 (Excludes Bathrooms and Kitchens)

| Rooms per Dwelling | Number |  | Percentage Distribution |  | Percentage Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Households | 18,449 | 15,584 | 100 | 100 | 18\% |
| Bedsitters and/ |  |  |  |  |  |
| One Room Dwellings | 1,401 | 915 | 8 | 6 | 538 |
| 2 Rooms | 2,787 | 1,890 | 15 | 12 | 47\% |
| 3 Rooms | 4,182 | 3,542 | 23 | 23 | 18\% |
| 4 Roons | 4,430 | 4,057 | 24 | 26 | 9\% |
| 5 Rooms | 2,890 | 2,775 | 16 | 18 | 4\% |
| 6 or More Rooms | 2,448 | 2,384 | 13 | 15 | 3\% |
| Rooms Not Stated | 311 | 21 | 2 | 0 | 1,380\% |

These findings imply that the demand for small dwellings continues strong and is being met in part by the splitting up of larger dwellings.

Households owning their own dwellings rose at a rate faster than the increase in the rate of growth of all households. However, households leasing and renting furnished housing grew even more rapidly. Households renting unfurnished twellings increased at a substantially slower rate than the rate of household formation, whereas households living rent-free were fewer in 1980. (See Table xxvi.)

The outcome of these trends was that home owners increased their share of housing stock as did households leasing or renting furnished premises. Households renting unfurnished dwellings or residing rent-free gave up 5 percentage points of their share of occupied dwellings.

|  | Number |  | Percentage Distribution |  | Percentage Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Tenure | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Households | 18,449 | 15,584 | 100 | 100 | 18\% |
| Owner Occupied | 7,308 | 6,087 | 40 | 39 | 20\% |
| Leased | 481 | 284 | 3 | 2 | 69\% |
| Rent Furnished | 2,998 | 2,323 | 16 | 15 | 29\% |

Census 80 reveals that the trend towards apartment dwelling first identified in 1970 continued although $75 \%$ of all Bermuda households lived in detached houses with one apartment. Eleven percent of all households occupied apartments in buildings with three dwelling units while $13 \%$ had taken up residence in buildings with four or more units.

Between 1970 and 1980, the number of households occupying single detached houses actually declined by 352 while the number of households residing in multi-unit buildings increased. Thus in 1980 the proportion of Bermuda households living in single detached houses had fallen from 54\% in 1970 to 44\% in 1980.

Households residing in all other types of dwellings increased their share of the total housing stock by one to three percentage points.

> TABLE (xxvii) - HOUSEHOLDS BY TYPE OF BUILDING 1980 AND 1970

| Type of Building | Number |  | Percentage Distribution |  | Percentage Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Households | 18,449 | 15,584 | 100 | 100 | 18\% |
| 1 Unit | 8,042 | 8,394 | 44 | 54 | -4\% |

| Other Type |  |  |  |  |  |
| Dwelling | 74 | 75 | - | - | -1\% |
| Not Stated | 165 | 1 | 1 | - | - |

There is evidence that the rate of construction of dwelling units was far lower than was the case for the previous decade. Since October 25, 1970 only 2,458 households reported that their dwelling units had been created over that period. In 1970, 3,292 households reported that their living quarters had been created during the previous decade. (See Table xxviii.)

Of interest here is the fact that during the more recent decade only 1,720 persons were added to the resident civilian population compared with over 10,000 between 1960 and 1970. Yet new households formed by 1980 numbered 2,865 compared with 3,068 between 1960 and 1970. This finding supports widely held views that the demand for housing was resulting from the breaking up of the traditional household as a result of youngsters setting $u$ on their own, marriage breakups whereby the separated partners opt to live on their own, and a reduction in the number of family members--particularly parents--residing with the nuclear family.

```
TABLE (xxviii) - HOUSEHCLOS BY YEAR WHEN DWELLING BUILT 1980 AND 1970
```

| Year Dwelling Built | Number |  | Percentage Distribution |  | Percentage Change 1970 to 1980 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| 10 years or |  |  |  |  |  |
| longer | 15,587 | 12,088 | 84 | 78 | 29\% |
| Not Stated | 404 | 204 | 2 | 1 | 98\% |

It would appear that the high standard of housing recorded in 1970 was improved upon, but this cannot be asserted because the level of non-response to the question "material of outer walls" was actually higher than the number of houses which could be categorised as having been constructed of standard materials. However, the findings indicate that households residing in dwellings of wood or some combination of wood and other materials declined by 30\% between 1970 and 1980. (See Table xxix.)

Of interest also is the substantial drop in households residing in dwellings built of Bermuda stone and the correspondingly marked rise in the number of dwellings constructed of cement block and a combination of stone and cement block. Since Bermuda stone has not been an important source of building material except for roofing over the past decade, it follows that the demand for housing has been met as much by additions to existing houses as by the creation of new ones.

TABLE (xxix) - HOUSEHOLDS BY MATERIAL OF OUTER WALLS

| Material of Outer Walls | Number |  | Percentage Distribution |  | Percentage Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Households | 18,449 | 15,584 | 100 | 100 | 18\% |
| Bermuda stone | 11,932 | 13,060 | 65 | 84 | -9\% |

| Other and Not Stated | 588 | 34 | 3 | 0 | 1,629\% |

Evidence that the already high standard of water supply and tollet facilities has improved is irrefutable. Between 1980 and 1970 the 802 households who reported that they obtained water by dipping from a tank or from an outdoor pump had fallen to 502 or 3\% of all households. On the other hand, households who reported that they not only had water piped indoors but could make use of a supplementary supply obtained fram a well, Watlington water works or sea water had increased from 7\% of all households to 16\%. (See Table xxx.)

TABLE ( $x \times x$ ) - HOUSEHOLDS BY WATER SUPPLY

| Water Supply | Number |  | Percentage Distribution |  | Percentage Change$1970 \text { to } 1980$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980 | 1970 |  |
| All Households | 18,449 | 15,584 | 100 | 100 | 18\% |
| Piped Indoors With Supplementary Supply | 2,860 | 1,131 | 16 | 7 | 153\% |
| Piped Indoors Without Supplementary Supply | 14,839 | 13,613 | 80 | 87 | 9\% |

| Not Stated | 230 | 0 | 1 | 0 | na |

Another significant improvement in housing was the finding that households using an outhouse had declined from 662 to 271, a mere 1\% of the household total. Further, the number sharing toilet facilities declined from 772 to $\mathbf{3 2 0}$ which constituted $2 \%$ of all households. (See Table xxxi.)

TABLE (xxxi) - HOUSEHOLDS BY TOILET FACILITIES
AND DEGREE OF PRIVACY

| Toilet Facilities | Number |  | Percentage Distribution |  | Percentage Change |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1980 | 1970 | 1980 | 1970 | 1970 to 1980 |
| All Households | 18,449 | 15,584 | 100 | 100 | 18\% |
| Type of Facility |  |  |  |  |  |
| Flush Toilet | 17,849 | 14,922 | 97 | 96 | 20\% |
| Pit or Other Means of Disposal | 271 | 662 | 1 | 4 |  |
|  | 329 | 0 | 2 | 0 | 56\% |
| Degree of Privacy |  |  |  |  |  |

| Not Stated | 197 | 0 | 1 | 0 | na |

Efforts by households to improve their housing standards have not been without cost. Examination of median rents and the rent level at which $10 \%$ and $5 \%$ of the population obtain living quarters, reveals that rent levels almost tripled at the three points of measurement. Thus in 1970 median rent--the rent level matched or exceeded by $50 \%$ of rent paying households--stood at \$90. By 1980 this level had increased more than $21 / 2$ times to \$237. For persons occupying high cost rental units--classified as the top $5 \%$-rents rose from $\$ 239$ in 1970 to $\$ 686$ in 1980.
(See Tables xxxi and xxxil.)

TABLE (xxxii) - MEDIAN RENTS AND RENTS AT THE HIGHEST 5\% and 10\% FOR ALI BERMLOA HOUSEHOLDS - 1970 AND 1980

| Census | Number of Household | Monthly Rent Paid ; |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Top 5\% | Top 10\% | Median |
| Date | Reporting | \$ | \$ | \$ |
| 1980 | 9,746 | \$686 | \$484 | \$237 |
| 1970 | 7,850 | 239 | 185 | 90 |
| Percentage |  |  |  |  |
| Change |  | 187\% | 162\% | 163\% |

Rents may also be viewed in terms of the proportion of households paying rent at fixed intervals. Thus in 1970 more than half of households renting paid less than $\$ 100$ monthly. However, by 1980 this proportion had fallen to $6 \%$. The number of households paying between $\$ 100$ and $\$ 200$ per month continues high at 30\% although this proportion is lower by 4 percentage points than was the situation in 1970. Thus $93 \%$ of all household paid less than $\$ 200$ per month in 1970 compared with only $36 \%$ in 1980. (See Table xxxiii.)

While in 1970 only 7 households paying rent were charged $\$ 300$ a month or more, by 1980 this proportion had risen to $64 \%$. Of particular interest is the fact that $10 \%$ of all households faced rents of an excess of $\$ 500$ monthly at the date of the latest census.

TABLE (xxxiii) - ONLY HOUSEHOLDS REPORTING RENTS BY AMOUNT OF MONTHLY RENT REPORT

| Monthly <br> Rent Paid | Number |  | Percentage Distribution |  | Percentage Change <br> 1970 to 1980 |
| :---: | :---: | :---: | :---: | :---: | :---: |

| \$1000 or higher | 247 | 0 | 3 | 0 | na |

* Figures obtained by interpolation.

Some Other Aspects of Households
The 1980 Census has provided considerable information on household types and the characteristics of heads of household. Analyses of these are best suited to a study limited to households. Three aspects of households not presented in 1980 are mentioned here:

- Occupancy Rates
- Household Types
- Headship Rates

Occupancy rates in 1980--number of persons per room--are described in Table (xxxiv), 14,856 or $82 \%$ of all Bermuda house-
holds occupy dwellings which allow at least one room for every occupant. There were 2,999 or $17 \%$ of all households in dwellings in which there are more than one and as high as two persons per room. To the extent that this group consists of large house-holds-over half have 5 or more persons per household--these dwellings are potentially overcrowded.

The final groups of households are those with more than two persons per room which number 283 in 1980 or $2 \%$ of the total. These dwellings are overcrowded.

| 7 or more persons | 562 | 3 | 25 | - | 406 | 14 | 131 | 46 |

* Excludes 311 households who did not state the number of rooms in the dwelling.

Five types of household were classified for analysis. These were Nuclear--some combination of the head, spouse/partner and children of the union; Related--nuclear plus another relative other than the offspring of the head or spouse; Non-related-single person; Mixed--all others not defined above.

Nuclear households made up 58\% of all households. These were followed in importance by single person households (25\%) and mixed (12\%).

When age is considered as a factor of analysis, Bermuda's most typical household is nuclear and the head is aged 25 to 44. These constitute $30 \%$ of all households. Next in importance are nuclear households whose heads are aged 45 to 64 . These constitute $19 \%$ of the population. The only remaining group of any significance are single-person households whose heads are aged 25 to 44.

TABLE ( $x x x y$ ) - PRIVATE HOUSEHOLDS BY SELECTED AGE OF HEAD AND TYPE OF HOUSEHOLD

| Type of Household | Selected Age of Head |  |  |  |  |

Households headed by women rose from 3,559 in 1970 to 5,324 in 1980 thus increasing their share of total households by 6 percentage points to $29 \%$ of all households.

The proportions of women heading households were equally divided between nuclear type households and single person households. However, almost two thirds of women heading nuclear households were under the age of 45 while for single person households the reverse was true.
table (xxxvii) - PRIVATE hOUSEHOLDS HEADED BY WOMEN BY SELECTED AGE OF HEAD AND TYPE OF HDUSEHOLD

| SUMMARY |  |  |  |  |  |

The 1980 Census reveals that life in Bermuda has improved materially since 1970. A small and slowly growing resident population now services a tourist industry which has nearly doubled in size even though the de facto population - the entire population - found on the island on Census Day - has changed very little.

The poulation has aged - the median age in 1980 at 28 years was up by almost 3 years from 1970. However, this aging has not resulted from a large influx of foreign workers as in 1970 but rather from a continued fall in birth rates as evidenced by the fall in the proportion of the population under 15 from $30 \%$ to 23\%.

The demographic profile of women has undergone interesting changes. The number of women of aged $15-45-$ child-bearing age--has risen by $17 \%$, considerably greater than that recorded for males in the same age group.

Expectedly, the marked increase in the number of wanen meant an equally substantial rise in the labour force participation rate of women. However this factor only partly accounted for the increased proportion of wamen in the work force. Of significance also was the tendency of women of child-bearing age to have fewer children and also to forego marital union.

Perhaps an additional incentive for women to get more involved in economic activity has been the growth of service industries which traditionally employ large numbers of wanen. Thus the increasing importance of goverrment as an employer, and the marked growth of financial institutions, the international community and the hotel and restaurant industry have all provided ample opportunity for wamen to enter the job market.

On a broader scale, the increase in the service industries and the reduction in manufacturing, construction, and other industries which use large proportions of men has meant that many men have had either to be retrained in order to obtain
suitable employment or else function at a level below their skill potential. The implications of male dissatisfaction due to this factor together with the increased competition for jobs by women at all levels needs to be explored.

The expansion in employment has seen substantial gains by blacks in all major occupational groups. However, these gains still leave their share of the high prestige, high earning occupations substantially below the proportion their share of the work-force would imply.

White and other races increased their numbers in the workforce only slightly in 1980 and this was reflected in declining shares of the jobs in virtually all major occupational categories. Nonetheless, despite a significant decrease in their share of the professional, technical and managerial occupations, they still controlled a substantially higher share of these jobs than did blacks.

Bermudianisation was well in evidence over the decade as the number of foreign-born workers actually declined. Nonetheless, foreign-born workers continue to hold the majority of the professional, technical and related occupations and a little over 40\% of all administrative and managerial positions.

Certainly residents are making a serious effort to cope with the demand for skills. The 1980 results reveal that the proportion of residents who have obtained a diploma or degree has almost tripled since 1970.

Smaller families together with substantial shifts into the high-paying occupations, particularly for wanen, has meant more discretionary income for Bermudians. Much of this income undoubtedly has been used not only to improve skills but also housing standards.

The number of residents living in Bermuda's version of substandard housing was reduced substantially in 1980 from already low levels existing in 1970. Further, it is clear that occupancy levels have fallen in the face of ever decreasing household size.

This drive for better housing however has forced more and more residents into apartment living and has made the single detached dwelling somewhat of a luxury.

Residents have paid dearly for this improvement. Since 1970 median rents have advanced more than two and a half times the

1970 level and now stand at $\$ 237$, some $\$ 147$ over the 1970 median rent. Further, households in the top 5\% of rent payers were faced with rents of $\$ 686$ or higher for accommodation.

The difficulties associated with satisfying an increased desire to live in one's own "pad" probably has accounted for the continued high rates of internal migration. Certainly, the fact that most internal migration is from the densely populated central parishes to the ôuter parishes supports this view.

Calvin J. M. Smith
Census Superintendent

October 22, 1980
